Maryland General Assembly
2021 Session

FISCAL AND POLICY NOTE
Third Reader - Revised

House Bill 832 (Delegate Fraser-Hidalgo)

Economic Matters and Environment and Transportation

Finance

Public Utilities – Electric School Bus Pilot Program

This bill establishes the Electric School Bus Pilot Program, implemented and administered by the Public Service Commission (PSC). An investor-owned electric company (“utility”) may apply to PSC to implement a pilot program, as specified. Generally, under the program, a utility installs interconnection equipment and provides rebates to local school systems to cover incremental costs of an electric bus fleet, and the school system allows the utility to access the stored electricity without additional compensation at times when the school system determines that the buses are not needed to transport students. Subject to PSC approval and specified conditions, a utility may recover all reasonable and prudent program costs incurred under the program through a rate application. Beginning in 2023, a utility that establishes a pilot program must annually report on the program, in consultation with each participating school system, as specified.

Fiscal Summary

State Effect: Special fund expenditures for PSC increase by $200,000 in FY 2022. Special fund revenues increase correspondingly from assessments imposed on public service companies. The effect on electricity prices is unknown.

Note: () = decrease; GF = general funds; FF = federal funds; SF = special funds; - = indeterminate increase; (−) = indeterminate decrease

Local Effect: Local government revenues (from utility rebates) and expenditures (for electric buses and related costs) increase to the extent that local school systems opt to participate in the pilot program, beginning in FY 2022, and further discussed below. The overall effect on a particular local government is unknown.
Small Business Effect: Minimal.

Analysis

Bill Summary: A utility may apply to PSC to implement an electric school bus pilot program if the program is structured to begin by October 1, 2023, and:

- provide for the deployment of at least 25 electric school buses;
- provide for electric school bus rebates to participating school systems equal to the incremental costs of purchasing and deploying electric school buses and incremental administrative and operating costs;
- limit total rebates to $50.0 million;
- allow the utility to use the storage batteries of the electric school buses to access the stored electricity through vehicle-to-grid technology, generally without additional compensation to the school system for the electricity, at times when the participating school system determines that the school buses are not needed to transport students (a utility that uses electricity that a participating school system provides to charge an electric school bus battery must replace that electricity at no cost);
- provide for the selection of school systems that apply to participate in the pilot program on the basis of appropriate factors determined by the utility with the approval of PSC, including the locational benefits that the storage batteries of school buses are expected to bring to the utility;
- consider, in determining the appropriate factors used for the selection of school systems, the health and economic effects on low-income and minority communities;
- provide and install the interconnection equipment and interconnection facilities for electric vehicle charging stations and train school personnel in the proper use of such equipment and facilities; and
- equip each electric school bus with lap and shoulder belts in accordance with recommendations from the National Transportation Safety Board.

A participating school system must (1) when deploying electric school buses, consider criteria that benefits students who are eligible for free and reduced-price meals and (2) prior to the delivery of electric school buses, develop a plan for training and retaining any school system employee affected by the pilot program.

Generally, the initial duration of an electric school bus pilot program must be at least three years and may be up to five years; however, on the request of a utility, PSC may authorize an expansion of the scope, deployment, program costs, and duration of the pilot program.
Current Law: An electric school bus pilot program funded through electric utilities does not exist. Unless it fails to meet applicable school bus and motor vehicle safety standards, a school vehicle may be operated for 12 to 15 years, depending on the county and other requirements.

Chapter 492 of 2019 established the Zero-Emission Vehicle School Bus Transition Grant Program within the Maryland Department of the Environment to provide grants to local boards of education (and entities that contract with local boards to provide transportation services) to (1) purchase school buses that are zero-emission vehicles; (2) install electric vehicle infrastructure for charging school buses that are zero-emission vehicles; (3) engage in planning for a transition to using school buses that are zero-emission vehicles; and (4) fund pilot programs to experiment with a transition to school buses that are zero-emission vehicles.

State Fiscal Effect: PSC advises that the bill requires additional program analysis as well as additional staff time and resources to consider appropriate cost allocation and recovery for the affected investor-owned utilities. The COVID-19 pandemic and hiring freeze has negatively impacted the agency’s resources, making it necessary to utilize consulting assistance for these tasks. Therefore, special fund expenditures for PSC increase by $200,000 in fiscal 2022 for consultant services. Special fund revenues increase correspondingly from assessments imposed on public service companies.

The effect on electricity prices is unknown. Broadly, the bill contemplates the utilities receiving compensation in the electricity markets for the energy and/or capacity value of the school bus batteries – batteries which the school systems must generally allow the utilities to use without additional compensation. The effect on electricity prices will depend on the amount of revenue available to utilities from using the school bus batteries as authorized, versus the costs of the infrastructure investments and rebates, and the timing of the associated cost recovery.

Local Fiscal Effect: Local government revenues (from utility rebates) and expenditures (for electric buses and related costs) increase to the extent that local school systems opt to participate in the pilot program, beginning in fiscal 2022. The overall effect on a particular local government is unknown, but the bill contemplates a program that would have no net effect on a particular local government’s finances due to the purchase and deployment of electric school buses, if estimated incremental costs align with subsequent utility rebates. Still, there is the possibility that some costs or savings will not be included in utility rebates – whether they be unforeseen, tangential, or extend beyond the duration of the three- to five-year pilot program.

For example, electric buses are believed to have lower operating and maintenance costs over time – the duration of those potential savings, and whether/how they will be accounted
for in the overall calculation of incremental costs eligible for rebates, is not specified in the bill. It is conceivable that a school system could continue benefiting from its electric buses after the pilot program terminates and rebates cease.

There are four investor-owned utilities in the State, each of which may apply for a $50.0 million rebate pilot program. The Maryland State Department of Education advises that the cost of a traditional diesel-powered school bus can start at around $90,000, while a comparable electric-powered school bus can cost over $340,000. There are also additional capital costs related to electric school buses (e.g., electric charging stations and related infrastructure investments). *For illustrative purposes,* at a $250,000 incremental cost per bus, this equates to 800 school buses across school systems that opt to participate. For context, the existing school vehicle fleet is more than 7,200 vehicles.

**Additional Comments:** In February 2021, Montgomery County entered into a contract to begin the conversion of its diesel school bus fleet to electric. Under that agreement, which provides for more buses over time, the contractor owns all equipment and is responsible for all significant maintenance costs, and the county makes payments to the contractor for their use.
