

Favorable HB 1082 with proposed amendments.

This are Health Outcomes Are Linked to Exposure

Some of the biological effects of WiFi radiation are well characterized. In particular, WiFi radiation is known to have thermal effects on tissues, due to the absorption of microwave RFR by water, which results in heating of the water. These thermal effects can be seen in a variety of tissues, and form the basis for most of the health standards that currently apply to WiFi radiation. There are also concerns about non-thermal effects, including cancer.

Thank you,

Daniela D'Orazio
