

HB1161 Delegate Szeliga Public Health – Human Papillomavirus Vaccine – Information and Informed Consent (Christina’s Law)

Christina was a beautiful young woman. Christina would be alive today if the dangers of the HPV injection had been truthful and fully transparent.

I am in full support of Christina’s Law. Every parent should be aware, educated and know the risks of this potentially lethal injection. ALL risks should be well documented and clearly stated to parents and teens subjected to this medically recommended “vaccine”. Did you know California is attempting to yet again lower the age for this jab and make it mandatory to attend school? Did you know 20 years ago this was just for females, then approx 10 yrs ago the push to jab males also? Now the push for lowering the age and making it mandatory.

As Robert Kennedy Jr. has told us for the last 2 yrs, “they” need to get these shots on the children’s vaxx schedule to avoid accountability and to have liability protection. ONCE A VAXX IS ON THE PEDIATRIC IMMUNIZATION SCHEDULE they are no longer liable for death and injury. LINK:

<https://rumble.com/v1ojxig-rfk-explains-why-covid-jabs-would-be-added-to-the-pediatric-immunization-sc.html>

A great resource to track Vaccine Death and Side Effects: <https://www.vigiaccess.org/> Just agree to the search, then search Gardasil 9 or Gardasil. In the Reported Potential Side Effects Column there are 27 different categories of side effects and under each of those categories are at least another 30 or more refined categories.

These are only 10 of the facts missing from the VIS:

1. HPVs clear naturally 90% of the time in two years with no treatment.

2. Cervical cancer is preventable with regular Pap screening

3. It is necessary for females to continue with Pap screening even if vaccinated with HPV vaccines because the vaccine does not address all high-risk HPVs

4. Rates of HPV-associated cancers (cervical, vaginal, anal, penile, throat) have been very low in the US, under 1%, even prior to the introduction of HPV vaccines in 2006

5. HPV-related cancers are typically diagnosed in people over age 50 with other risk factors.

6. Symptoms associated with adverse events following HPV vaccination should be mentioned.

7. Adverse events following vaccination can occur weeks or even months after vaccination.

8. In post-licensure safety surveillance, the VAERS reporting rate for Gardasil was 3x greater than that for all other vaccines combined.

9. Females positive for HPV 16/18 who then get HPV vaccines could thereby increase their risk of getting cervical cancer by 44.6%. There is no pre-testing to see who is vulnerable

10. The vaccine contains known neurotoxins like aluminum and has not been tested for interaction with other vaccines given concurrently like COVID-19 vaccines.

I ask each of you to please support HB 1161 so that parents will not suffer the loss of a child or lose everything taking care of a vaccine injured child. All of this suffering could be prevented by TRUTH and FULL DISCLOSURE of side effects, injury and even death. If you could save one child would you not want to?

PLEASE SUPPORT CHRISTINA'S LAW, HB1161
